### Report

- comprehensions provide a concise way to create lists.
- It consists of brackets containing an expression followed by a for clause, then zero or more for or if clauses.
- The expressions can be anything, meaning you can put in all kinds of objects in lists.
- Defining a Function You can define functions to provide the required functionality. Here are simple rules to define a function in Python
- We use open () function in Python to open a file in read or write mode. ... will be closed automatically after one is done, so auto-cleanup. Example: filter\_none
- Importing Modules To make use of the functions in a module, you'll need to import the module with an import statement.
